Received and published: 6 April 2009

The authors present preliminary results regarding the Alikes Lagoon (Zakynthos Island, W. Greece). The included data are very interesting but they need a more in-depth discussion, for instance, the tectonic activity of the Volime fault as well the sea level changes should be more clearly related to the sedimentation nature and rates. From the technical point of view, the article needs a good revision of the English. In conclusion, keeping in mind the preliminary character of the paper, I should say that it is an interesting and promising effort.
